To-Do App Architecture on Replit
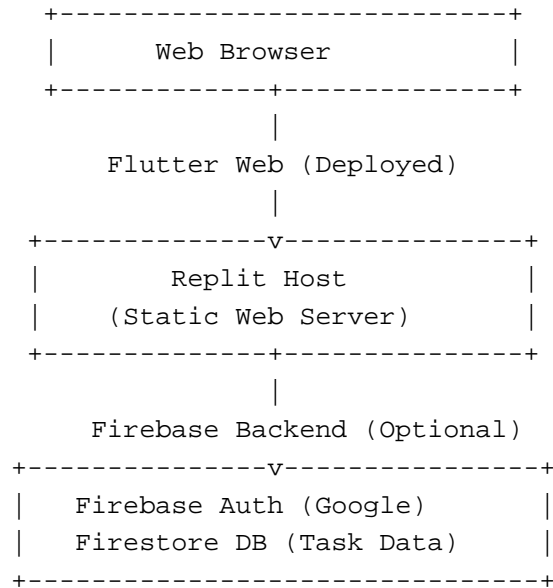

```
Architecture Option 1: Flutter Web on Replit (Frontend Only)
-------------------------------------------------------------

                +---------------------------+
                |        Web Browser        |
                +-------------+-------------+
                              |
                  Flutter Web (Deployed)
                              |
                +-------------v-------------+
                |        Replit Host        |
                |    (Static Web Server)    |
                +-------------+-------------+
                              |
                  Firebase Backend (Optional)
              +---------------v---------------+
              |    Firebase Auth (Google)     |
              |    Firestore DB (Task Data)   |
              +-------------------------------+

Architecture Option 2: Replit Fullstack App (Flask + HTML/JS)
-------------------------------------------------------------

                +---------------------------+
                |        Web Browser        |
                +-------------+-------------+
                              |
                  HTML/CSS/JS (Frontend)
                              |
                +---------------v---------------+
                |        Replit Server          |
                |    Python Flask or Node.js    |
                +---------------+---------------+
                                |
              +-----------------v-----------------+
              |        Local JSON DB (Simple)     |
              +-----------------------------------+
                              OR
              +-----------------v-----------------+
              |      Firebase / MongoDB (Scalable)|
              +-----------------------------------+
```
